-Voltage control and stabilisation,performed on the true Rms value,are managed by the digital microprocessor, - The output voltage regulation performed independently on each phase, - The instrumentation consist of a multi task digital power meter, such instrument is able to provide with information regarding the voltage stabilizer output parameter,such as phase and linked voltage,current,power factor,active power,apparent power etc. - The alarms(min/max output voltage,regulator overload) are recognizable by means of Powermeter error code on the control card. -It is also possible to communicate with the stabiliser with the RS-485(Modbus TCP/IP protocol.)(Optional)		By-pass kit
